

Open Text Document Server Connector for Microsoft Exchange

Capture and Archive Email from Microsoft® Exchange Server into a Secure and Compliant Repository

At a Glance

Do you need to meet legal and government requirements for email record keeping?

Open Text Document Server Connector for Microsoft Exchange provides a 24x7, tamper-proof process for capturing and preserving email in a secure archive, making it easy to comply with regulations and the demands of the legal discovery process.

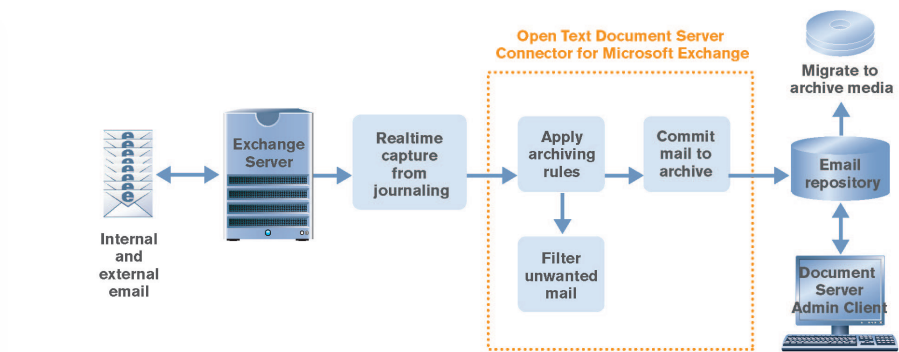

Do you need to monitor email corporate policy compliance?

Connector for Microsoft Exchange lets you search email traffic including the contents of attachments and find noncompliant messages within seconds.

Do you want an affordable solution that works and doesn't take forever to implement?

Connector for Microsoft Exchange is built on the stable, mature Open Text Document Server, Alchemy Edition content management system. It's up and running in hours not days or weeks.

Connector for Microsoft Exchange can be purchased as a complete and stand-alone email archiving solution, or added to the Document Server fixed content management system.

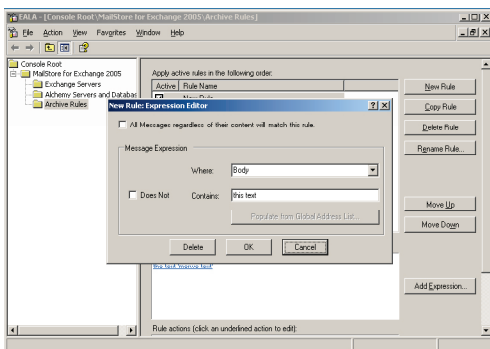

Imagine having your organization's emails and attachments in a single, secure repository. So you, or anyone you allow, can search, retrieve and view it. And manage its lifecycle. With Connector for Microsoft Exchange, you can.

Benefits of Connector for Microsoft Exchange

Fast Deployment is extremely fast—often in less than two hours—and without any third-party software integration or professional services. And best of all, no software is installed on your Exchange Server.

Compliant Connector for Microsoft Exchange utilizes a rules-based policy engine to control which email is archived, making it easy to meet regulatory guidelines for email record keeping. Rules can be set globally or for individual mailboxes and policies can be based on an email address or domain, a sender, a recipient and even the content of message subject lines. When a Connector for Microsoft Exchange installation is part of Open Text Document Server, Alchemy Advanced Edition, audit trails are kept and with the Open Text Document Server Records Manager Module, file plans and retention schedules can be applied.

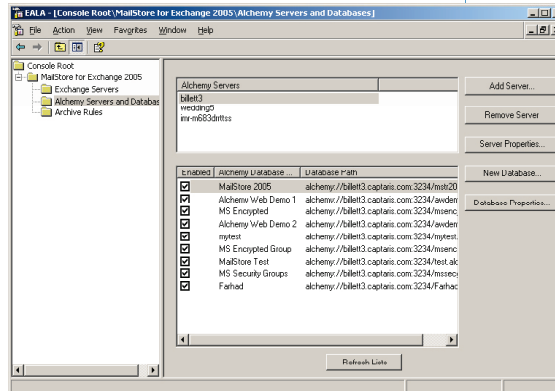

Create rules based on message content.

More Features of Connector for Microsoft Exchange

- A real-time and secure email archiving system. Search and retrieve emails by metadata fields within minutes of their being sent.
- Provide enterprise reliability and fault tolerant email storage and indexing.
- Set archiving policies based on message metadata content analysis, as opposed to file date or file size.
- Send emails to different archive repositories based on message metadata content.
- Store the archives onto CD, DVD and other types of hard disk or optical storage options; supports compliance with regulations calling for WORM.
- Extract content from email and attachments to enable full-text metadata search.
- Add read-only Search Client or Web Access Module for auditors, privacy officers, compliance officers, legal, etc.
- Easy to integrate with the optional Records Manager Module for lifecycle management.
- Easy to integrate with the optional Alchemy Advanced Server Audit Logging feature.
- Import and index Bloomberg Mail data files into a searchable archive with the optional Open Text Document Server DataGrabber Module.

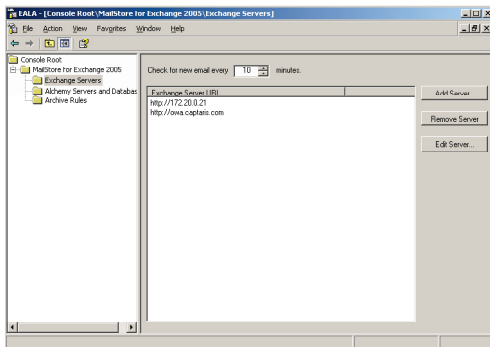

Flexible Built on Document Server and inheriting its storage neutrality, Connector for Microsoft Exchange can store email archives on hard disk or a variety of other media types including NAS, CD, DVD and optical libraries. (Third-party storage software may be required for some configurations.) You can even create stand-alone optical discs with selected emails to satisfy the demands of auditors or lawyers.

Searchable All messages and text attachments are indexed by full-text contents and email header data (Sender, Recipient, Subject Line and Date Sent). Use the Open Text Document Server Administrator Module (included with Connector for Microsoft Exchange) to search across mailbox archives and instantly view message content and attachments, all the software for viewing is included. For end-users to retrieve their own mailbox archives, add Open Text Document Server Search Client for Microsoft Windows or Open Text Document Server Web Access Module.

Archive messages from one or more Exchange Servers

Archive to as many repositories as needed
